

URINARY TRANSFER SYSTEM AND ASSOCIATED METHOD OF USE

ABSTRACT OF DISCLOSURE

There is a urinary transfer system and associated process that includes a urinal capable of receiving urine from a patient, urine holding container, a first conduit

5 connected between the urinal and the urine holding container, a pump, and a second conduit connected between the urine holding container and the pump. Preferably, there is a retainer that is associated with the urinal and a removable lid associated with the urine holding container. The urinary transfer system can be powered by any type of electrical power supply and/or battery. Optimally, there is a receiver electrically

10 connected to the pump to be able to turn the pump on and off and can preferably control the operation of the pump based on input received from a transmitter. An external male catheter can also be utilized in conjunction with the urinary transfer system.
